

# Algorithmic complexity and graphs: complexities

13 octobre 2023

# Complexity

- ▶ Today we will **quantify** the **complexity** of several problems :  
how many operations are required in order to answer a given question, as a function of the size of the input ?

# Complexity

- ▶ Today we will **quantify** the **complexity** of several problems : how many operations are required to answer a given question, as a function of the size of the input ? Is it possible to **compute** an answer with a computer ?
- ▶ Importantly, this is called the **time complexity** of the problem. It does not take the memory usage into account.
- ▶ However, we will also (shortly) discuss **space complexity**, that quantifies memory usage.

# Complexity

- ▶ The answer is that **it depends on the problem**. For some problems, it is very likely that there exists **no exact fast (polynomial)** solution (for instance the NP-hard problems)

## Average and worst case complexities

- ▶ Often, for a given algorithm, the exact number of operations needed will **depend on the instance of the problem**.
- ▶ It is possible to compute several complexities given a problem size  $n$  :
  - ▶ **worst-case** the maximum number of operation needed
  - ▶ **average-case** average complexity, averaged over a **distribution** on the input. Thus this distribution is to be known, or assumed.

- └ The problem of complexity
- └ Measuring time complexities

# Measuring complexities

- ▶ Let us start by measuring the complexity of some simple programs.
- ▶ We can first measure the computing time.

# Measuring execution times

## Exercice 1 : Linear complexity

- ▶ **cd complexity/** and use **linear\_complexity.py** to verify that the complexity of a sequence of multiplications is proportionnal to its length.

## Measuring execution times

### Exercise 1 : Linear complexity

- ▶ `cd complexity/` and use `linear_complexity.py` to verify that the complexity of a sequence of multiplications is proportionnal to its length.
- ▶ It should look like this :

## Measuring execution times

### Exercise 2 : Non linear complexity

- ▶ What happens with matrix multiplication ? Use **matrix\_multiplication.py** to estimate the computing time as a function of the size of the matrix.

## Measuring execution times

### Exercise 2 : Non linear complexity

- What happens with matrix multiplication ? Use **matrix\_multiplication.py** to estimate the computing time as a function of the size of the matrix.
- It should look like this :

## Matrix multiplication

- ▶ Let's give a rough approximation of the number of operations as a function of the size  $n$  of the matrix.

## Matrix multiplication

- ▶ Let's give a rough approximation of the number of operations as a function of the size  $n$  of the matrix.
- ▶ It should then be of order  $\mathcal{O}(n^3)$ . **Remark** : However, some **sub-cubic** algorithms exists : faster than  $n^3$

- └ The problem of complexity
- └ Measuring time complexities

## Measuring the time ?

- Why is **time** maybe not the best tool to evaluate the complexity of an algorithm ?

- └ The problem of complexity
- └ Measuring time complexities

## Measuring the time ?

- ▶ Why is **time** maybe not the best tool to evaluate the complexity of an algorithm ?
- ▶ It depends on the machine

- └ The problem of complexity
- └ Measuring time complexities

## Measuring the time ?

- ▶ Why is **time** maybe not the best tool to evaluate the complexity of an algorithm ?
- ▶ It depends on the machine
- ▶ We could count the number of elementary operations instead.

- └ The problem of complexity
- └ Measuring time complexities

# timeit

For a measurement of the execution time, timeit is also available :  
<https://docs.python.org/3/library/timeit.html>

- └ The problem of complexity
- └ Measuring time complexities

## Experimental evaluation

**Exercise 3 :** Counting the number of elementary operations

- ▶ Please use a variable in **exponentiation\_complexity.py** to compute the number of operations in fast exponentiation.

## Experimental evaluation

### Exercise 3 : Counting the number of elementary operations

- ▶ Please use a variable in `exponentiation_complexity.py` to compute the number of operations in fast exponentiation.
- ▶ It should look like :

## Experimental evaluation

**Exercise 3:** Counting the number of elementary operations

- We recognize the **logarithmic complexity**  $\mathcal{O}(\log n)$

- └ The problem of complexity
- └ Measuring time complexities

# Asymptotic behavior

- ▶ We study the **asymptotic** behavior, when  $n \rightarrow \infty$

- └ The problem of complexity
- └ Measuring time complexities

# Asymptotic behavior

- ▶ We study the **asymptotic** behavior, when  $n \rightarrow \infty$
- ▶ This tells if the algorithm **scales** (still works when the instance of the problem is larger)

## Asymptotic behavior : $\mathcal{O}$ notation (notation de Landau)

- ▶ Mathematically speaking, we say that  $f = \mathcal{O}(g)$  if the ratio  $\frac{|f(n)|}{|g(n)|}$  is **bounded**.

$$\exists A \geq 0, \forall n \in \mathbb{N}, \left| \frac{f(n)}{g(n)} \right| \leq A \quad (1)$$

- ▶  $||$  means "absolute value"
- ▶ intuitively, this means that  $f$  is "not bigger" than  $g$

## Asymptotic behavior : examples

$$n^2 + n = \mathcal{O}(?) \quad (2)$$

$$5 \times n^4 + 2178 \times n^3 + \log 3n = \mathcal{O}(?) \quad (3)$$

## Asymptotic behavior : examples

$$n^2 + n = \mathcal{O}(n^2) \quad (4)$$

$$5 \times n^4 + 2178 \times n^3 + \log 3n = \mathcal{O}(n^4) \quad (5)$$

## Asymptotic behavior : $o$ notation

- ▶ Mathematically speaking, we say that  $f = o(g)$  if the ratio  $\frac{|f(n)|}{|g(n)|}$  converges to 0 when  $n \rightarrow +\infty$

$$\lim_{n \rightarrow +\infty} \left| \frac{f(n)}{g(n)} \right| = 0 \quad (6)$$

- ▶ intuitively, this means that  $f$  is "smaller" than  $g$

## Asymptotic behavior : $o$ notation

- ▶ Mathematically speaking, we say that  $f = o(g)$  if the ratio  $\frac{|f(n)|}{|g(n)|}$  converges to 0 when  $n \rightarrow +\infty$

$$\lim_{n \rightarrow +\infty} \left| \frac{f(n)}{g(n)} \right| = 0 \quad (7)$$

- ▶ Please define this limit with quantifiers (quantificateurs) ?

## Asymptotic behavior : $o$ notation

- Mathematically speaking, we say that  $f = o(g)$  if the ratio  $\frac{|f(n)|}{|g(n)|}$  converges to 0 when  $n \rightarrow +\infty$

$$\lim_{n \rightarrow +\infty} \frac{f(n)}{g(n)} = 0 \quad (8)$$

$$\forall \epsilon > 0, \exists A \in \mathbb{R}, \forall n \geq A, \left| \frac{f(n)}{g(n)} \right| \leq \epsilon \quad (9)$$

## Asymptotic behavior : general rules

When  $n \rightarrow +\infty$  :

- ▶ if  $\alpha > 0$ ,  $\beta \in \mathbb{R}$ ,  $(\log n)^\beta = o(n^\alpha)$
- ▶ if  $0 < \alpha < \beta$ ,  $n^\alpha = o(n^\beta)$
- ▶ if  $a > 1$ ,  $n^\alpha = o(a^n)$
- ▶ if  $0 < a < b$ ,  $a^n = o(b^n)$

## Asymptotic behavior : equivalence

► We say that  $f(n) \underset{n \rightarrow +\infty}{\sim} g(n)$  when

$$f(n) \underset{n \rightarrow +\infty}{=} g(n) + o(g(n)) \quad (10)$$

## Asymptotic behavior : equivalence

- ▶ We say that  $f(n) \underset{n \rightarrow +\infty}{\sim} g(n)$  when

$$f(n) \underset{n \rightarrow +\infty}{=} g(n) + o(g(n)) \quad (11)$$

- ▶ When talking about complexities, we will be interested in the **simplest equivalent**.

# Equivalence

**Exercise 3 :** Find equivalents and the limits for the following functions :

- ▶  $u_n = 3n^3 - n^2(\sqrt{n} \sin n) + \cos(\sqrt{n})$
- ▶  $v_n = -0.2 * n^n + 10 * n^2 * n!$
- ▶ Maximum number of edges in a simple directed graph
- ▶  $n!$

- └ The problem of complexity
- └ Measuring time complexities

## Examples of algorithms

- ▶ Fast exponentiation
- ▶ Naive exponentiation
- ▶ Merge sort
- ▶ Insertion sort
- ▶ Matrix multiplication
- ▶ Enumeration of subsets, TSP, coloring
- ▶ Enumeration of permutations

- └ The problem of complexity
- └ Measuring time complexities

- ▶ Insertion sort  $\mathcal{O}(n^2)$
- ▶ Matrix multiplication  $\mathcal{O}(n^{2.37})$
- ▶ Enumeration of subsets, TSP, coloring  $\mathcal{O}(2^n)$
- ▶ Enumeration of permutations

## Examples of algorithms

- ▶ Fast exponentiation  $\mathcal{O}(\log n)$
- ▶ Naive exponentiation  $\mathcal{O}(n)$
- ▶ Merge sort  $\mathcal{O}(n \log n)$
- ▶ Insertion sort  $\mathcal{O}(n^2)$
- ▶ Matrix multiplication  $\mathcal{O}(n^{2.37})$
- ▶ Enumeration of subsets, TSP, coloring  $\mathcal{O}(2^n)$
- ▶ Enumeration of permutations  $\mathcal{O}(n!)$

- └ The problem of complexity
  - └ Measuring time complexities

## Orders of magnitude

### Orders of magnitude

Taille	$n \log n$	$n^3$	$2^n$
$n = 20$	60	8000	1048576
$n = 50$	196	125000	1125899907000000
$n = 100$	461	1000000	12676506000000000000000000000000

⇒ Hence the idea of a border between polynomial and exponential algorithms.

# Profiling

- ▶ Another useful tool to monitor the execution of a program is **profiling**
- ▶ From the python docs : "A profile is a set of statistics that describes how often and for how long various parts of the program executed"
- ▶ <https://docs.python.org/3.6/library/profile.html>

# Profiling

## Exercise 4 : Profiling a piece of code

- ▶ **cd profiling** and profile some programs that we used before
- ▶ However note that when profiling **profiling\_demo.py**, the elementary multiplications are not taken into account in the profiling output.

# Time complexities in python

<https://wiki.python.org/moin/TimeComplexity>

# Computing complexities

We now want to compute some complexities with paper and pen.  
Let us focus on some intuitive rules :

- ▶ For a sequence of blocks :
- ▶ For a loop :

# Computing complexities

We now want to compute some complexities with paper and pen.  
Let us focus on some intuitive rules :

- ▶ For a sequence of blocks : complexities sum up
- ▶ For a loop :

## Computing complexities

We now want to compute some complexities with paper and pen.  
Let us focus on some intuitive rules :

- ▶ For a sequence of blocks : complexities sum up
- ▶ For a loop : complexities of all iterations sum up
- ▶ If a loop consists in similar iterations, its complexity is the product of the complexity of one iteration by the size of the loop.

### Exercise 5 : Computing a running time I

Please compute the complexity of the following algorithm.

```
result = 0
for i in range(n):
    result += i**2
```

### Exercise 6 : Computing a running time II

Please compute the complexity of the following algorithm.

```
for i in range(n):  
    for j in range(i):  
        l = [i+j+k for k in range(n)]
```

## Running times

**Exercise 7 :** Computing a running time II

Could we have known that is was polynomial without performing the exact computation ?

```
for i in range(n):  
    for j in range(i):  
        l = [i+j+k for k in range(n)]
```

## Some mathematical concepts

- ▶ Mathematical induction
- ▶ Applications : prime factors decomposition,  $\sum_{k=1}^n k$
- ▶ Optional

$$\sum_{k=1}^n k^2 ? \quad (12)$$

$$\sum_{k=1}^n k^3 ? \quad (13)$$

# Insertion Sort

- ▶ We will study the classic **Insertion sort algorithm**, in order to illustrate the concept of **average-case complexity**.

- └ The problem of complexity
- └ Insertion sort

# Insertion Sort

Exercise 8 : Insertion sort :

`cd insertion_sort/` and fix the function in `insertion_sort.py` in order to perform the algorithm.

## Average-case complexity

- ▶ We assume a **uniform distribution** on the integer that we want to sort. All values have the same probability.
- ▶ What is the average-case complexity of the algorithm ?

# Complexity

**Exercise 9** : use the file **complexity.py** in order to check if our theoretical result is correct. You will need to fix the function **number\_of\_operations()**

# Python sorting

In python, `sort()` uses a variant of mergesort.

<https://github.com/python/cpython/blob/master/Objects/listsort.txt>

# Horner Algorithm

- ▶ Let us consider the case of evaluating polynoms
- ▶ A polynom is a function of the form
$$f : x \rightarrow a_n x^n + a_{n-1} x^{n-1} + \cdots + a_1 x + a_0$$
- ▶ How many multiplications are involved with the naive method ?

# Horner Algorithm

- ▶ Let us consider the case of evaluating polynoms
- ▶ A polynom is a function of the form
$$f : x \rightarrow a_n x^n + a_{n-1} x^{n-1} + \dots + a_1 x + a_0$$
- ▶ How many multiplications are involved with the naive method?
- ▶ We look for an algorithm that is faster than the naive solution.

# Horner Algorithm

- Example of Horner algorithm when  
 $P : x \rightarrow 7x^4 + 2x^3 - 5x + 1 :$

$$P(x) = (((7x + 2)x + 0)x - 5)x + 1 \quad (14)$$

# Horner Algorithm

- ▶ Example of Horner algorithm when  
 $P : x \rightarrow 7x^4 + 2x^3 - 5x + 1 :$

$$P(x) = (((7x + 2)x + 0)x - 5)x + 1 \quad (15)$$

- ▶ How many multiplications are now involved ?

# Horner Algorithm

- ▶ Example of Horner algorithm when  
 $P : x \rightarrow 7x^4 + 2x^3 - 5x + 1 :$

$$P(a) = (((7a + 2)a + 0)a - 5)a + 1 \quad (16)$$

- ▶ How many multiplications are now involved?  $\mathcal{O}(n)$ .
- ▶ So we went from quadratic to linear.

# Horner Algorithm

- ▶ Example of Horner algorithm when

$$P : x \rightarrow 7x^4 + 2x^3 - 5x + 1 :$$

$$P(x) = (((7x + 2)x + 0)x - 5)x + 1 \quad (17)$$

- ▶ We input the polynom to the algorithm as the list of the coefficients  $[a_n, a_{n-1}, \dots, a_0]$

## Evaluating polynoms

### Exercise 9 : Implementation of Horner Algorithm

- ▶ Example of Horner algorithm when

$$P : x \rightarrow 7x^4 + 2x^3 - 5x + 1 :$$

$$P(x) = (((7x + 2)x + 0)x - 5)x + 1 \quad (18)$$

- ▶ We input the polynom to the algorithm as the list of the coefficients  $[a_n, a_{n-1}, \dots, a_0]$
- ▶ Please modify **complexity/horner.py** so that it performs the horner algorithm.
- ▶ In order to test that our method is correct, we will test it against the method **polyval** from **numpy**.

# Horner

## ► `help(numpy.polyval)` :

```
Horner's scheme [1]_ is used to evaluate the polynomial. Even so,
for polynomials of high degree the values may be inaccurate due to
rounding errors. Use carefully.
```

# Linear systems

In many applications, we must solve **linear systems** (backboard). To do so, several algorithms exist and the optimal one will depend on the input (similarly to sorting). In the following slides, the **conjugate gradient algorithm (CG)** from scipy is compared to the scikit-learn implemenration which uses `numpy.linalg.lstsq`.
