augmenting path step 1

Warm up question

Given an **undirected** graph with n nodes, how many edges can we build ?

Notation of a graph : $G(V, E)$

- ▶ V : set of n vertices
- ▶ E : set of edges

What if the graph is directed ?

Warm up question

Given an **directed** graph with n nodes, how many edges can we build ?

Warm up question

Given an **directed** graph with n nodes, how many edges can we build ?

$$n(n - 1) \quad (1)$$

Warm up question

Given an **directed** graph with n nodes, how many edges can we build ?

$$n(n - 1) \quad (2)$$

So if the graph is **undirected**, we can build :

$$\frac{n(n - 1)}{2} \quad (3)$$

edges.

Remark

$\frac{n(n-1)}{2}$ is also the number of subsets of size 2 in a set of size n .

$$\binom{n}{2} = \frac{n!}{2!(n-2)!} \quad (4)$$

Matching problem

Let us now focus on the **matching problem** (problème du **couplage**)

Back to our problem

Given a **undirected** graph $G = (V, E)$, we want a **matching** M , which means:

- ▶ A subset of edges $M \subset E$

Back to our problem

Given a **undirected** graph $G = (V, E)$, we want a **matching**, which means:

- ▶ A subset of edges $M \subset E$
- ▶ Such that no pairs of edges of M are incident
- ▶ Equivalently, each node in the graph is **at most** in one edge of M .

Back to our problem

Given **undirected** a graph $G = (V, E)$, we want a **matching**, which means:

- ▶ A subset of edges $M \subset E$
- ▶ Equivalently, each node in the graph is **at most** in one edge of M .
- ▶ No pairs of edges of M are incident

Maximum matching

- ▶ The **size** of a matching is the number of edges it contains.

Maximum matching

- ▶ The **size** of a matching is the number of edges it contains.
- ▶ We want to find the matching of maximum size in a given graph.

Example 1

Figure: Is this a matching ?

Overview

Example 4

Figure: Is this an optimal matching ?

Example 5

Figure: With neato

Optimal matching

Exercise 1 : Given a graph of size n , what is maximum size possible for a **matching** ?

Optimal matching

Exercise 1 : Given a graph of size n , what is maximum size possible for a **matching** ?

- ▶ If n is even : $\frac{n}{2}$
- ▶ Else n is odd : $\frac{n-1}{2}$

Optimal matching

Exercise 1 : Given a graph of size n , what is maximum size possible for a **matching** ?

- ▶ If n is even : $\frac{n}{2}$
- ▶ Else n is odd : $\frac{n-1}{2}$

Hence,

$$\left\lfloor \frac{n}{2} \right\rfloor \quad (5)$$

- └ The matching problem
 - └ Definition of the problem

Optimal matching

Exercise 1 : Can you think of a graph with n nodes that contains a matching of size $\frac{n}{2}$? (assuming n is even)

Optimal

Exercise 1: Can you think of a graph with n nodes that contains a matching of size $\frac{n}{2}$? (assuming n is even)

Figure: The complete graph works

Optimal matching

Exercise 1 : Can you think of a graph with n nodes that does **not** contains a matching of size $\frac{n}{2}$? (assuming n is even)

Optimal matching

Exercise 1: Can you think of a graph with n nodes that does **not** contain a matching of size $\frac{n}{2}$? (assuming n is even)

- └ The matching problem
- └ Definition of the problem

Optimal matching

Exercise 1 : Can you think of a **non trivial** graph that does **not** contains a matching of size $\frac{n}{2}$? (assuming n is even)

Optimal matching

Exercise 2: Can you think of a **non trivial** graph that does **not** contains a matching of size $\frac{n}{2}$? (assuming n is even)

Figure: Star graph

Experiments

Possibilities to code a graph:

- ▶ list of sets of size 2 (for an undirected graph)
- ▶ a dictionary of successors (directed or undirected)

Coding a graph : as a list

```
g1 = [{1,2},{1,3},{2,3},{3,4},{1,4}]
```

Coding a graph : as a dictionary

```
g1 = { 1:{2,3,4}, 2:{1,3}, 3:{1,2,4}, 4:{1,3} }
```

Generating graphs with networks.

Directed graph

Directed graph II

Directed graph III

Example directed graph

Manual matching

Exercise 3 : Please manually find an **optimal matching** in your **undirected** graph.

Big graph

We could not manually find an optimal matching in this graph :

Summary

- ▶ We have defined the matching problem.
- ▶ When the size of the problem is large, we can not manually find an optimal matching.

Brute force approach

Exercise 4 : Enumeration

- ▶ Given a graph, what would a brute force approach on the matching problem be ?

Brute force approach

Exercise 4 : Exhaustive search

- ▶ Given a graph what would a brute force approach on the matching problem be ?
 - ▶ 1) Enumerate all possible subsets in the set of the edges.
 - ▶ 2) Check if each subset is a matching.
 - ▶ 3) Return the biggest one obtained.

Brute force approach

Exercise 4 : Exhaustive search

- ▶ Given a graph what would a brute force approach on the matching problem be ?
 - ▶ 1) Enumerate all possible subsets in the set of the edges.
 - ▶ 2) Check if each subset is a matching.
 - ▶ 3) Return the biggest one obtained.

If the graph contains n nodes, and given a subset of edges, what if the number of computations needed to perform step 2 ?

Brute force approach

Exercise 4 : Exhaustive search

- ▶ Given a graph what would a brute force approach on the matching problem be ?
 - ▶ 1) Enumerate all possible subsets in the set of the edges.
 - ▶ 2) Check if each subset is a matching.
 - ▶ 3) Return the biggest one obtained.

If the graph contains n nodes, and given a subset of edges, what if the number of computations needed to perform step 2 ?

You can give a rough approximation.

Brute force approach

Exercise 4 : Exhaustive search

- ▶ Given a graph what would a brute force approach on the matching problem be ?
 - ▶ 1) Enumerate all possible subsets in the set of the edges.
 - ▶ 2) Check if each subset is a matching.
 - ▶ 3) Return the biggest one obtained.

If the graph contains n nodes, and given a subset of edges, what if the number of computations needed to perform step 2 ?

It is a **polynomial** number of computations : so it is ok.

Brute force search

Exercise 5 : Complexity of brute force

- ▶ 1) Enumerate all possible subsets in the set of the edges.
- ▶ 2) Check if each subset is a matching.
- ▶ 3) Return the biggest one obtained.

What is the complexity of step 1 ?

Brute force search

Exercise 5 : Complexity of brute force

- ▶ 1) Enumerate all possible subsets in the set of the edges.
- ▶ 2) Check if each subset is a matching.
- ▶ 3) Return the biggest one obtained.

What is the complexity of step 1 ?

The number of subsets is $2^{\frac{n(n-1)}{2}}$ (in the worst case), which is exponential. If p is the number of edges, we can also write it as 2^p .

Brute force search

Exercise 5: Complexity of brute force

Assume that checking a subset requires 1 microsecond. How long should we wait in order to check all possible matchings in a graph with 100 nodes ?

Summary II

- ▶ For the matching problem on a large graph, we can neither
 - ▶ manually find an optimal matching
 - ▶ perform the exhaustive search (brute force algorithm)

Algorithms

- ▶ Hence, we need different algorithms to solve the problem.
- ▶ Let us first introduce some theoretical notions.

Notion of maximal and maximum matching

We will say that a matching M of cardinality (number of elements) $|M|$ is:

- ▶ **Maximum** if it has the maximum possible number of edges (is thus optimal)

Notion of maximal and maximum matching

We will say that a matching M of cardinality $|M|$ is:

- ▶ **Maximum** if it has the maximum possible number of edges (is thus optimal)
- ▶ **Maximal** if the set of edges obtained by adding any edge to it is **not a matching**. This means that $M \cup \{e\}$ is not a matching for any e not in M .
- ▶ \cup means union of sets.

Is being a **maximal** matching the same thing as being a **maximum** matching ?

Maximum implies maximal

Let us show that a maximum matching is maximal.

Counter Example

However, a matching that is maximal is **not necessary Maximum**.

Counter Example

However, a matching that is maximal is **not necessary Maximum**.
Can you find an example ?

Overview

- └ The matching problem
 - └ Greedy algorithm

(a) A maximal matching not maximum

(b) A maximum matching

Greedy algorithm

Can you propose a greedy algorithm to address the maximum matching problem ?

Greedy algorithm

Result : Matching M

$M \leftarrow \emptyset;$

for $e \in E$ **do**

if $M \cup \{e\}$ *is a matching* **then**

$M \leftarrow M \cup \{e\}$

end

end

return M

Algorithme 0 : Greedy algorithm to find a matching

Greedy algorithm

- ▶ What is the type of matching algorithm returned by this algorithm ?
- ▶ What is the complexity of this algorithm ? (as a function of the number of nodes n of the graph)

Access times

<https://wiki.python.org/moin/TimeComplexity>

Greedy algorithm

- ▶ The greedy algorithm returns a **maximal** matching (proof)
- ▶ Its complexity is smaller than $\mathcal{O}(np)$ (n nodes, p edges) (proof)
- ▶ smaller than **cubic** in the number of nodes : $\mathcal{O}(n^3)$

Greedy algorithm

- We will implement the greedy algorithm to find a maximal matching.

Exercise 6: `cd matching_greedy/` and use `generate_graph.py` to build a graph with a least 30 nodes. The images are stored in `images/`, data stored in `data/`

Implementing the greedy algorithm

Exercise 6 : Implement the greedy algorithm on this graph.

- ▶ Use the functions in **matching_functions.py** and call them from **apply_matching_algorithm.py**
- ▶ More details in the file.

Example

Exercise 7 : Can you think of an example where the greedy algorithm gives a **bad** matching, e.g. of the size **half** the size of an optimal matching ?

Example

Exercise 7 : Can you think of an example where the greedy algorithm gives a **bad** matching, e.g. of the size **half** the size of an optimal matching ?

Greedy matching

However, is $|M|$ is the cardinality of a matching returned by the greedy algorithm, and if $|M^*|$ is the cardinal of the real optimal matching, we can theoretically show that :

$$|M| \geq \frac{|M^*|}{2} \tag{6}$$
